

Experiment - 3

1) Aim/Objective:

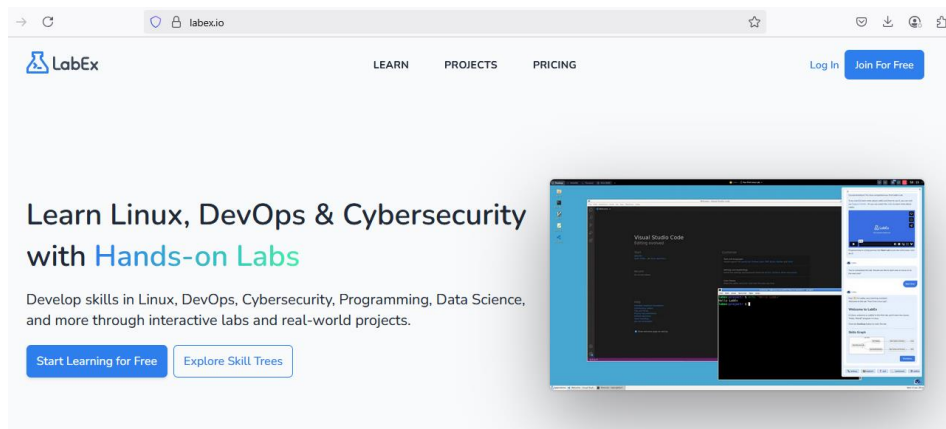

Study and installation of Platform as Service on Labex

2) Practical

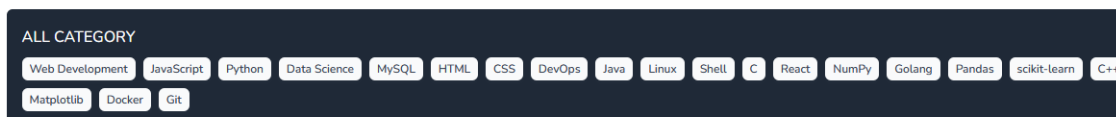

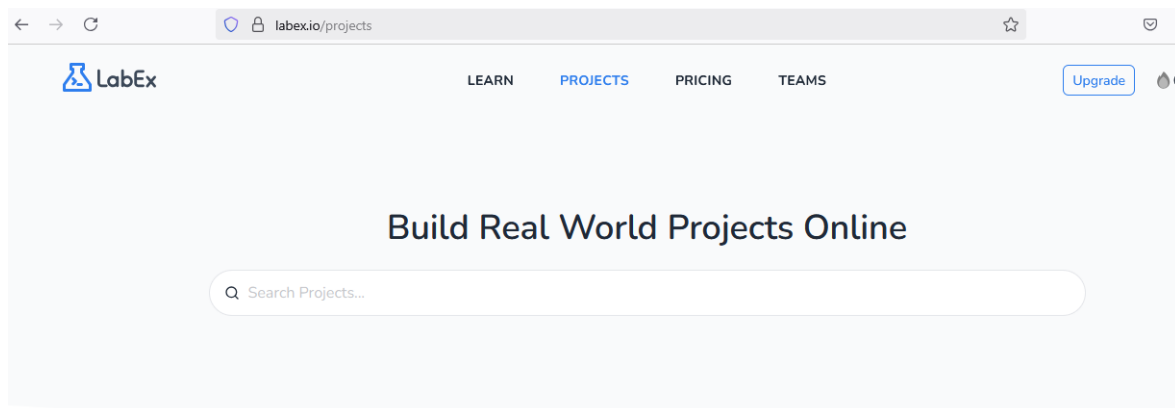

LabEx is an interactive, hands-on learning platform that provides virtual environments for practicing various technical skills, including Linux. To use LabEx for Linux labs, follow these general steps:

:

- **Access the LabEx Platform:**
 - Navigate to the LabEx website (labex.io).
 - Sign up or log in to your account.

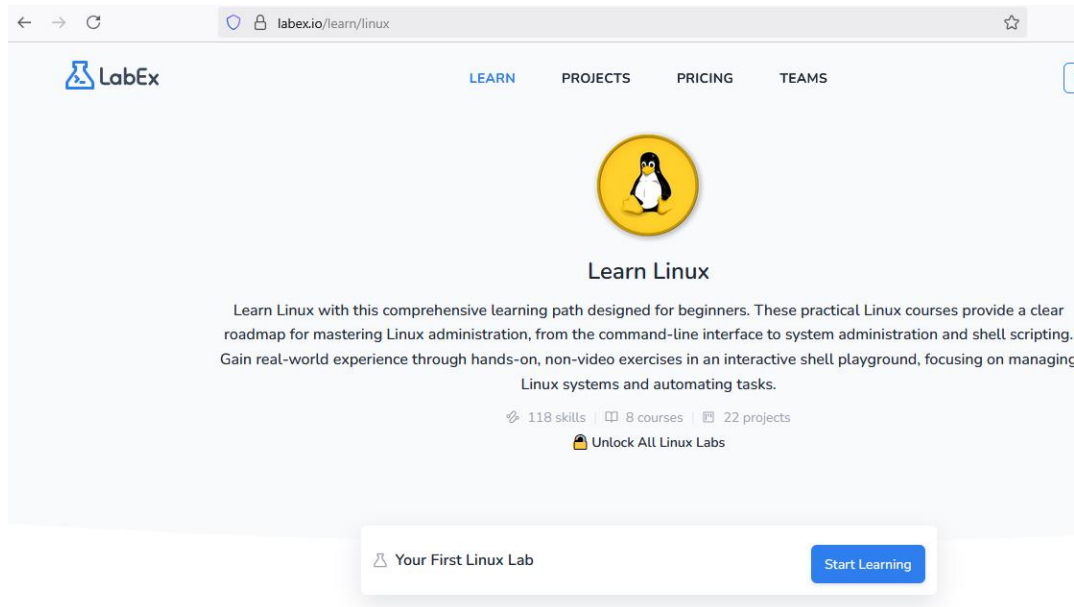

- **Find a Linux Lab or Course:**
 - Browse the available labs or courses related to Linux. You can find labs on topics like basic commands, file system management, shell scripting, system administration, Docker, and more.
 - Select the lab or course that aligns with your learning goals.

- **Start the Lab:**

- Once you've chosen a lab, click on the "Start Lab" or similar button. This will provision a virtual environment (a Linux virtual machine) for you in your browser.

- **Interact with the Virtual Environment:**

- The LabEx interface typically consists of two main parts:
 - **Instructions Panel:** This panel provides step-by-step instructions, explanations, and often sample code or commands to guide you through the lab exercises.
 - **Virtual Machine/Terminal:** This is your interactive Linux environment, usually presented as a web-based terminal or a graphical interface to the virtual machine.

- **Follow the Instructions:**

- Read the instructions carefully in the instructions panel.
- Execute the commands or perform the actions described in the virtual machine's terminal or interface. For example, you might be asked to use commands like `ls`, `cd`, `mkdir`, `sudo apt install`, or to edit files.

- **Complete the Tasks:**

- As you progress through the lab, you will complete various tasks and exercises. LabEx often includes automated checks to verify if you have successfully completed each step.

- **Stop the Lab:**

When you are finished with a lab, click on the "Stop Lab" or "End Lab" button to release the virtual environment and save your progress (if applicable).
